Subject Index

A

Aggregation, row-column, rectilinear distance p-median problems and, 160–174

Airlines
  daily fleet assignment, swapping applications in, 237–248
  fleet assignment, maintenance and crew considerations in, 249–260

Algorithms
  Benders' decomposition-based heuristic, just-in-time systems, facility layout problem, 315–329
  elementary, theory and, bicriterion traffic assignment, 93–111
  fast, single-sink fixed charge transportation problems and, transportation and manufacturing applications, 276–290
  model formulation and, train routing through railway stations, 181–194
  models and, distribution problems with uncertain demands and, 43–59

Allocation, location and, fixed service units acting as $M/G/1$ queues, optimal allocation, 60–74

Assignment
  airline fleet
    maintenance and crew considerations in, 249–260
    swapping applications in, 237–248
  bicriterion traffic, basic theory and elementary algorithms, 93–111
  non-convex traffic, rectangular grid network, 32–42

Automation
  material handling systems, design and control, stochastic modeling for, 330–350
  single-vehicle guided vehicle systems, multiple load capacity, design, 351–363

B

Bicriterion traffic assignment, basic theory and elementary algorithms, 93–111

C

Customers, non-nested, capacitated location problems, straight line, 75–80

D

Deliveryman problem, depth-first solutions, tree-like networks, evaluation with permutation model, 134–147

Distance constraints
  locations network problems, composite feasibility regions, 148–159
  multifacility location problem, tree, sequential location scheme, 261–269

Distance problems, rectilinear p-median, row-column aggregation, 160–174

Distribution, problems with uncertain demands, models and algorithms for, 43–59

Dynamic assignment problem, stochastic formulation, truckload motor carriers and, 195–219

E

Equity constraints, time windows and, multiple vehicle traveling salesman problem, multiple day horizon, 120–133

F

Facility layout problems, just-in-time support, Benders' decomposition-based heuristic algorithm for, 315–329

Feasibility, composite regions, distance constrained location network problems, 148–159

Fleet assignment
  airline, maintenance and crew considerations in, 249–260
  daily airline, swapping applications, 237–248

Flight legs, airline daily fleet assignment, swapping applications in, 237–248

Flow, prediction, time-varying urban network, dynamic systems/variational inequalities/control theoretic models and, 14–31

H

Heuristic
  Benders' Decomposition-based, facility layout supporting just-in-time and, 315–329
  network flow-based tabu search, vehicle routing problem, 379–393

I

Indication, sequences, left-turn phasing and, operational performance simulation study, 112–119

Intervals, non-nested customer, capacitated location problems on a line, 75–80

J

Just-in-time systems, facility layout problem, Benders' decomposition-based heuristic algorithm for, 315–329

L

Label setting procedure, relaxation-based pruning technique in, stochastic shortest path problem, 220–236

Left-turn phasing, indication sequences and, operational performance simulation study, 112–119

Load matching problems, long-haul truckload trucking, dynamic assignment problem, stochastic formulation, 195–219

Location
  allocation and, fixed service units acting as $M/G/1$ queues, optimal allocation, 60–74
  capacitated problems, straight line and, non-nested customer intervals, 75–80
  distance constrained network problems, composite feasibility regions, 148–159
  institutional problems, rectilinear distance p-median problems, row-column aggregation, 160–174
  multifacility, distance-constrained problem on tree, sequential location scheme, 261–269

M

Manufacturing
  material handling systems, design and control, stochastic modeling for, 330–350

materials flow, production/transportation/distribution planning in, multi-commodity tri-echelon system, mixed integer model, 291–302
single-vehicle automated guided vehicle systems, multiple load capacity, design, 351–363
transportation and, single-sink fixed charge transportation problems, fast algorithms for, 276–290
Material handling systems
design and control, stochastic modeling for, 330–350
single-vehicle automated guided vehicle systems, multiple load capacity, design, 351–363
p-Median problems, rectilinear distance, row-column aggregation, 160–174
Models
algorithms and, distribution problems with uncertain demands and, 43–59
control theoretic, dynamic systems/variational inequalities and, predicting time-varying urban network flows, 14–31
formulation, algorithms and, train routing through railway stations, 181–194
performance, on-time line-haul prediction, scheduled railroad operations, 364–378
permutation, evaluation of depth-first solutions to deliveryman problem, tree-like network, 134–147
traffic network equilibrium, transportation network policy, goal targets and penalty functions and, 3–13
Multi-commodity system, tri-echelon, production/transportation/distribution planning in, mixed integer programming, 291–302
Multifacility location problems, distance-constrained, trees and, sequential location scheme for, 261–269

N

Networks
directed, stochastic shortest path problem, relaxation-based pruning technique, 220–236
location problems, distance constraint, composite feasibility regions, 148–159
rectangular grid, non-convex traffic assignment on, 32–42
time-varying urban, flow prediction, dynamic systems/variational inequalities/control theoretic models and, 14–31
transportation, scheduling and sequencing problems, routing two-machine flowshop problem, 303–314
transportation policy modeling, goal targets and penalty functions and, 3–13
tree-like, depth-first solutions to deliveryman problem, evaluation with permutation model, 134–147

O

Overnight delivery business, multiple vehicle traveling salesman problem, time windows and equity constraints, multiple day horizon, 120–133

P

Planning, production/transportation/distribution, multi-commodity tri-echelon system, mixed integer programming, 291–302
Policy modeling, transportation network, goal targets and penalty functions and, 3–13
Programming, mixed integer model, production/transportation/distribution planning, multi-commodity tri-echelon system, 291–302
Pruning, relaxation-based technique, stochastic shortest path problem, 220–236

Q

Queues, $M/G/1$, fixed service units acting as, optimal allocation, 60–74

R

Railroads
routing through railway stations, model formulation and algorithms, 181–194
scheduled operations, on-time line-haul performance prediction, 364–378
Revenue maximization, airlines fleet assignment, maintenance and crew considerations in, 249–260
Robert Herman Lifetime Achievement Award, Transportation Science Section of INFORMS, award to Denos C. Gazis (May 1996), 89
Routing, trains through railway stations, model formulation and algorithms, 181–194
Routing two-machine flowshop problem, special structure networks, scheduling and sequencing problems, 303–314

S

Scheduling, sequencing and, routing two-machine flowshop problem, special structure networks, 303–314
Sequential location scheme, distance constraints, tree, multifacility location problem, 261–269
Service units, fixed, $M/G/1$ queues and, optimal allocation, 60–74
Shortest path problem, stochastic, relaxation-based pruning technique for, 220–236
Simulation
left-turn phasing and indication sequences, operational performance, 112–119
performance, on-time line-haul prediction, scheduled railroad operations, 364–378
Swapping applications, daily airline fleet assignment, 237–248

T

Tabu search, flow-based heuristic, network, vehicle routing problem, 379–393
Time windows, equity constraints and, multiple vehicle traveling salesman problem, multiple day horizon, 120–133
Traffic
bicriterion assignment, basic theory and elementary algorithms, 93–111
non-convex assignment, rectangular grid network, 32–42
Trains
routing through railway stations, model formulation and algorithms, 181–194
scheduled operations, on-time line-haul performance prediction, 364–378
Transportation, manufacturing and, single-sink fixed charge transportation problems, fast algorithms for, 276–290
Traveling repairman problem, depth-first solutions, tree-like networks, evaluation with permutation model, 134–147
Traveling salesman problem, multiple vehicle, time windows and equity constraints, multiple day horizon, 120–133
Trucking, truckload, dynamic assignment problem, stochastic formulation, 195–219

V

Vehicle routing problems, flow-based tabu search heuristic for, network, 379–393
